Grundlagenpraktikum: Rechnerarchitektur (GRA)

Maximilian Eichenseher, Timon Daniel, Hendrik Kahlsdorf

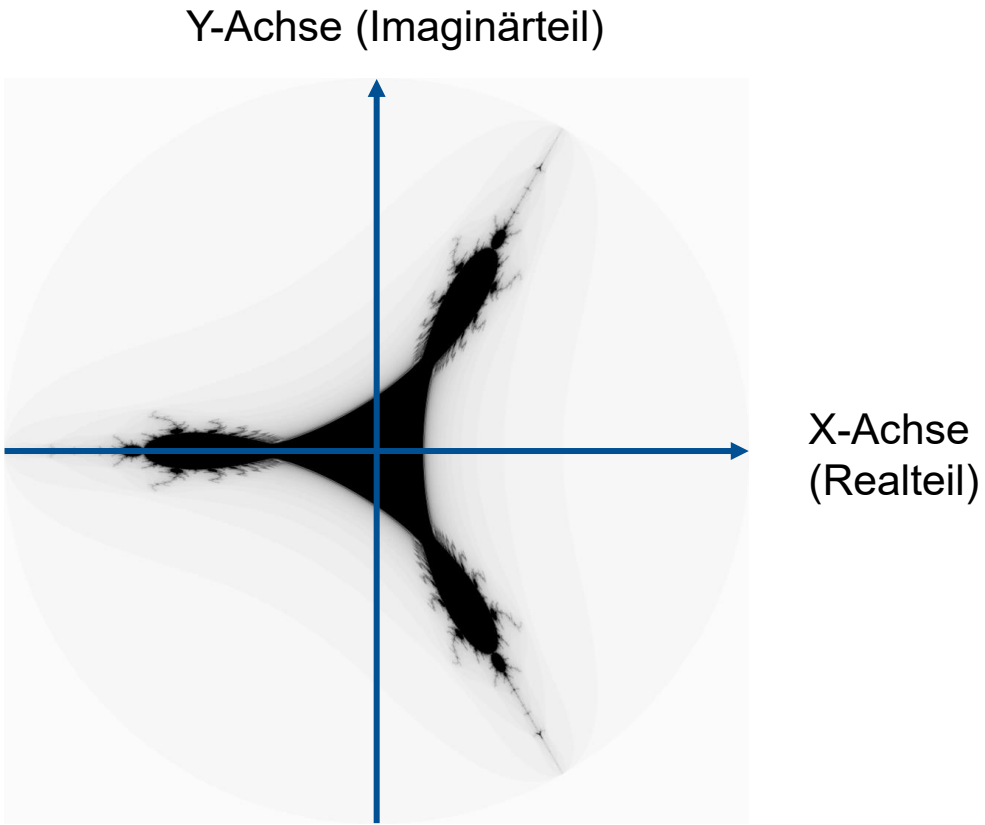

25. August 2026

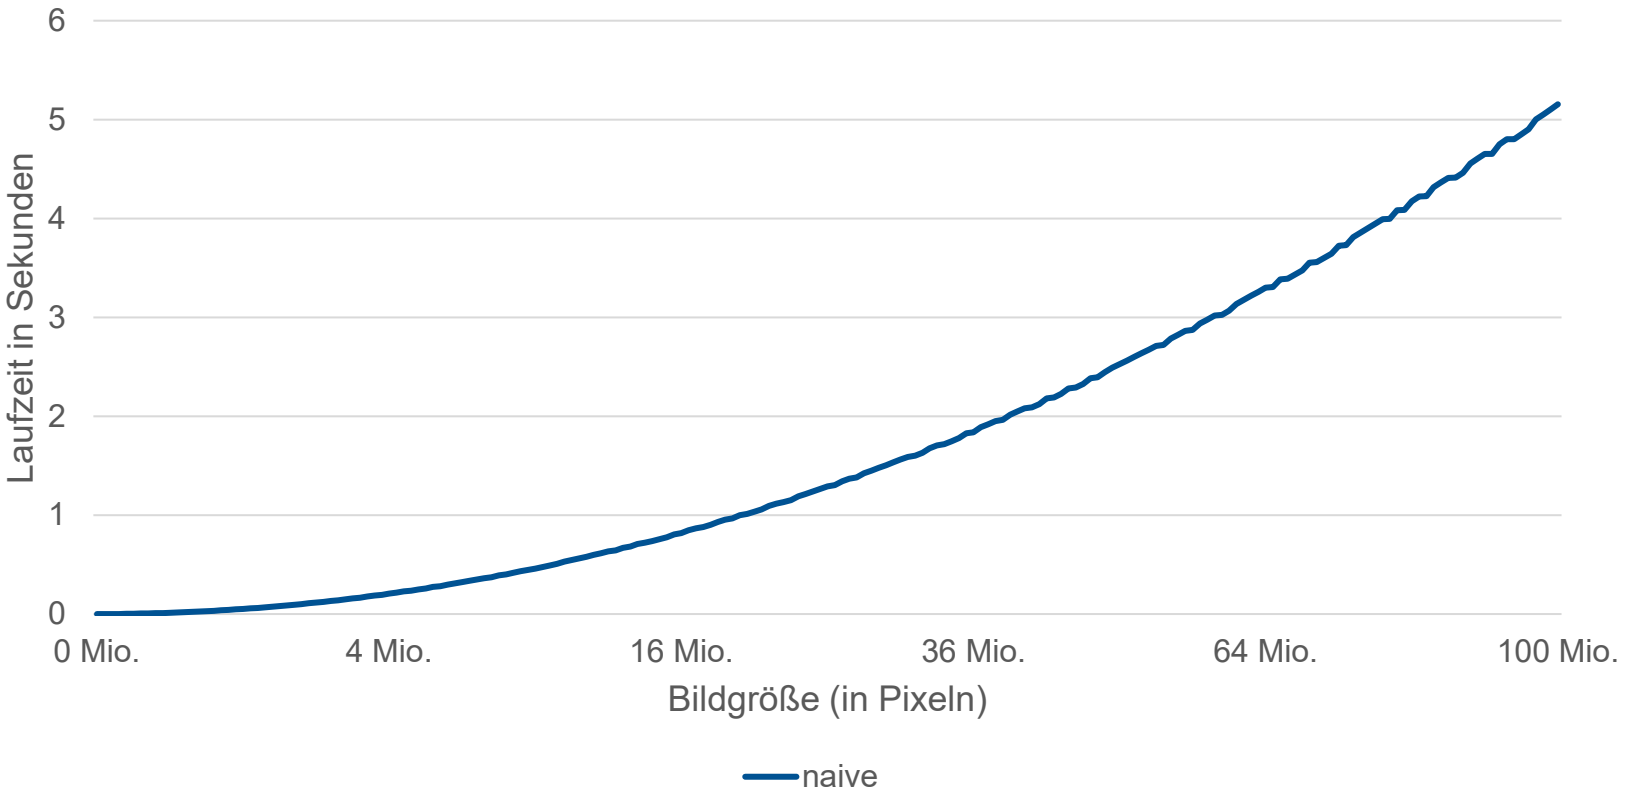

Erklärung Trikorn-Fraktal

Formel:

$$z_{i+1} = \overline{z_i}^m + c \; (i \geq 0)$$

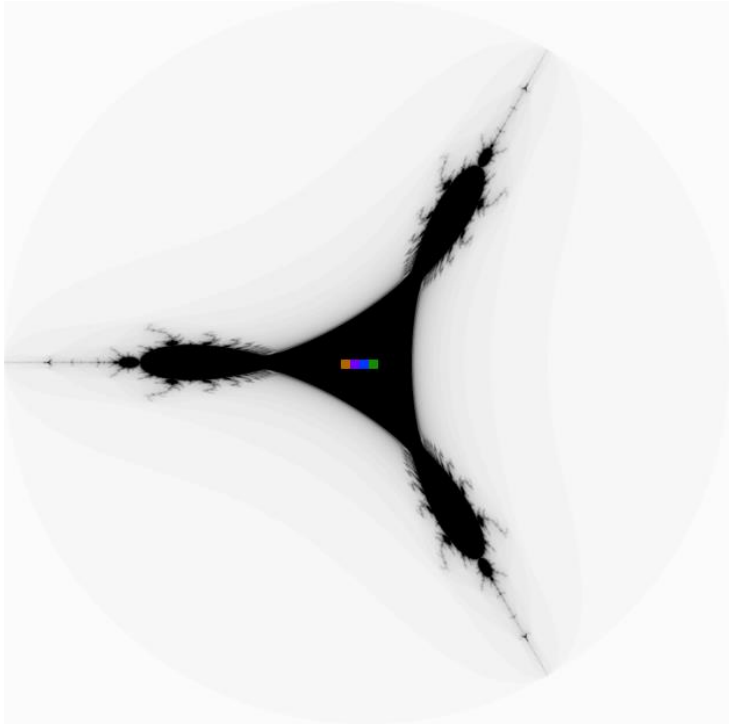

Laufzeit Naiv (Bildgröße)

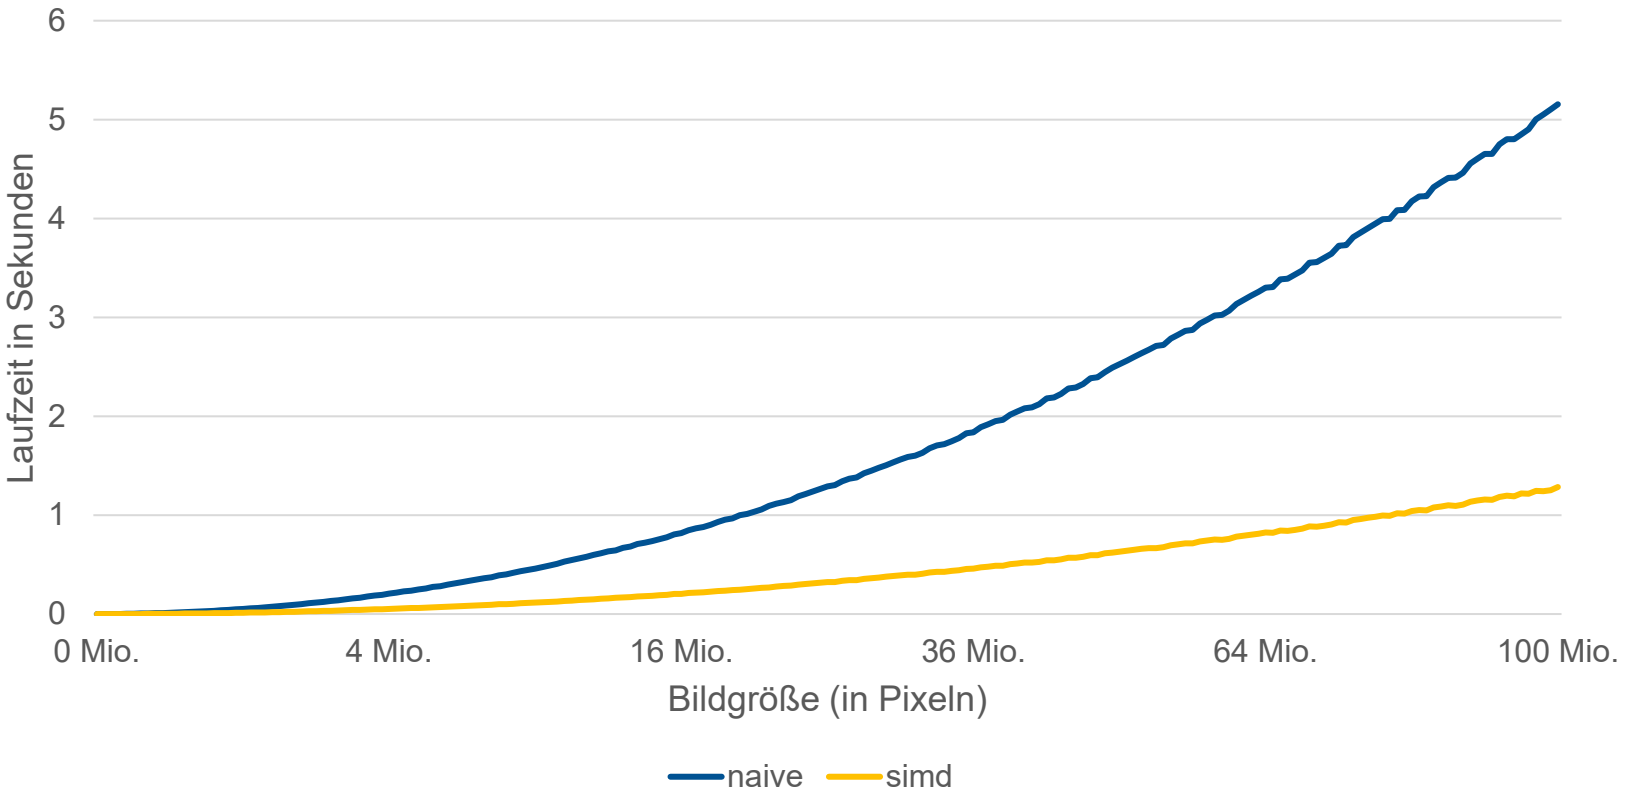

SIMD Optimierung

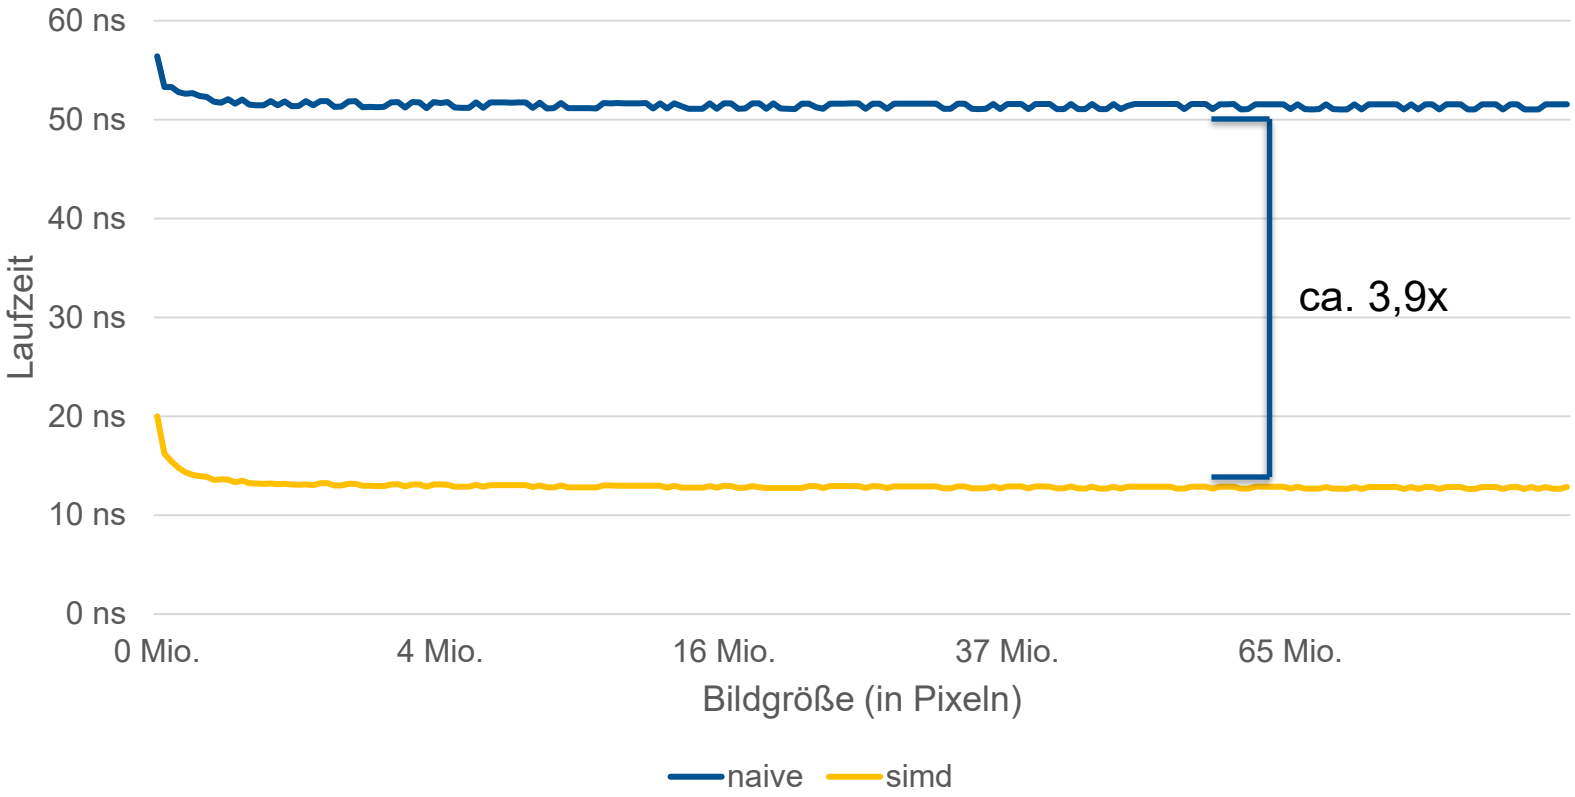

__m128 {x1, x2, x3, x4}

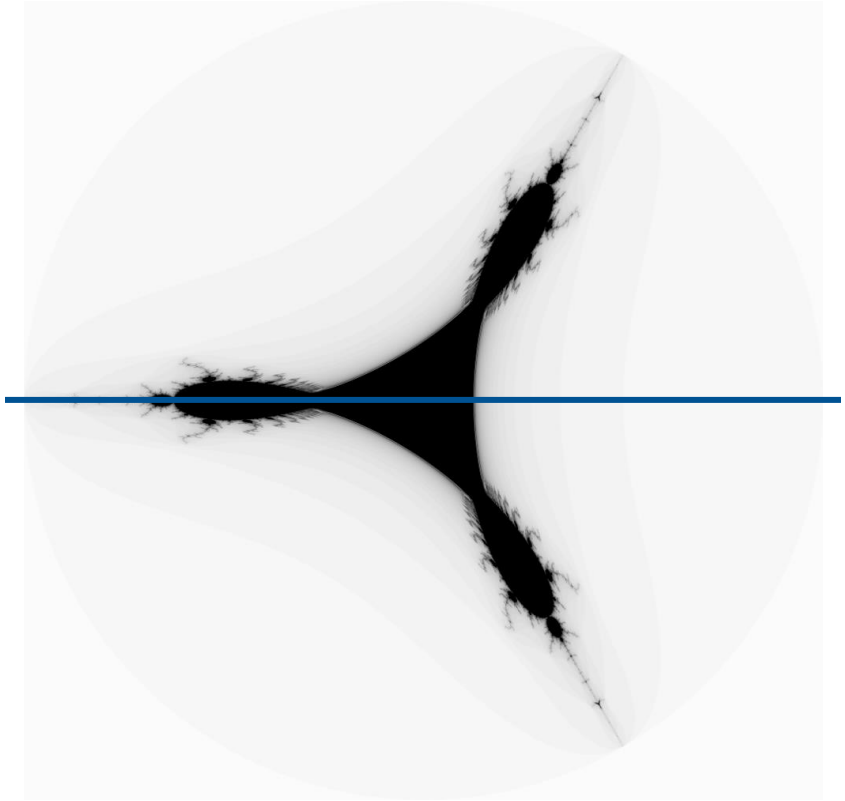

Laufzeit (Bildgröße): Naiv vs. Simd

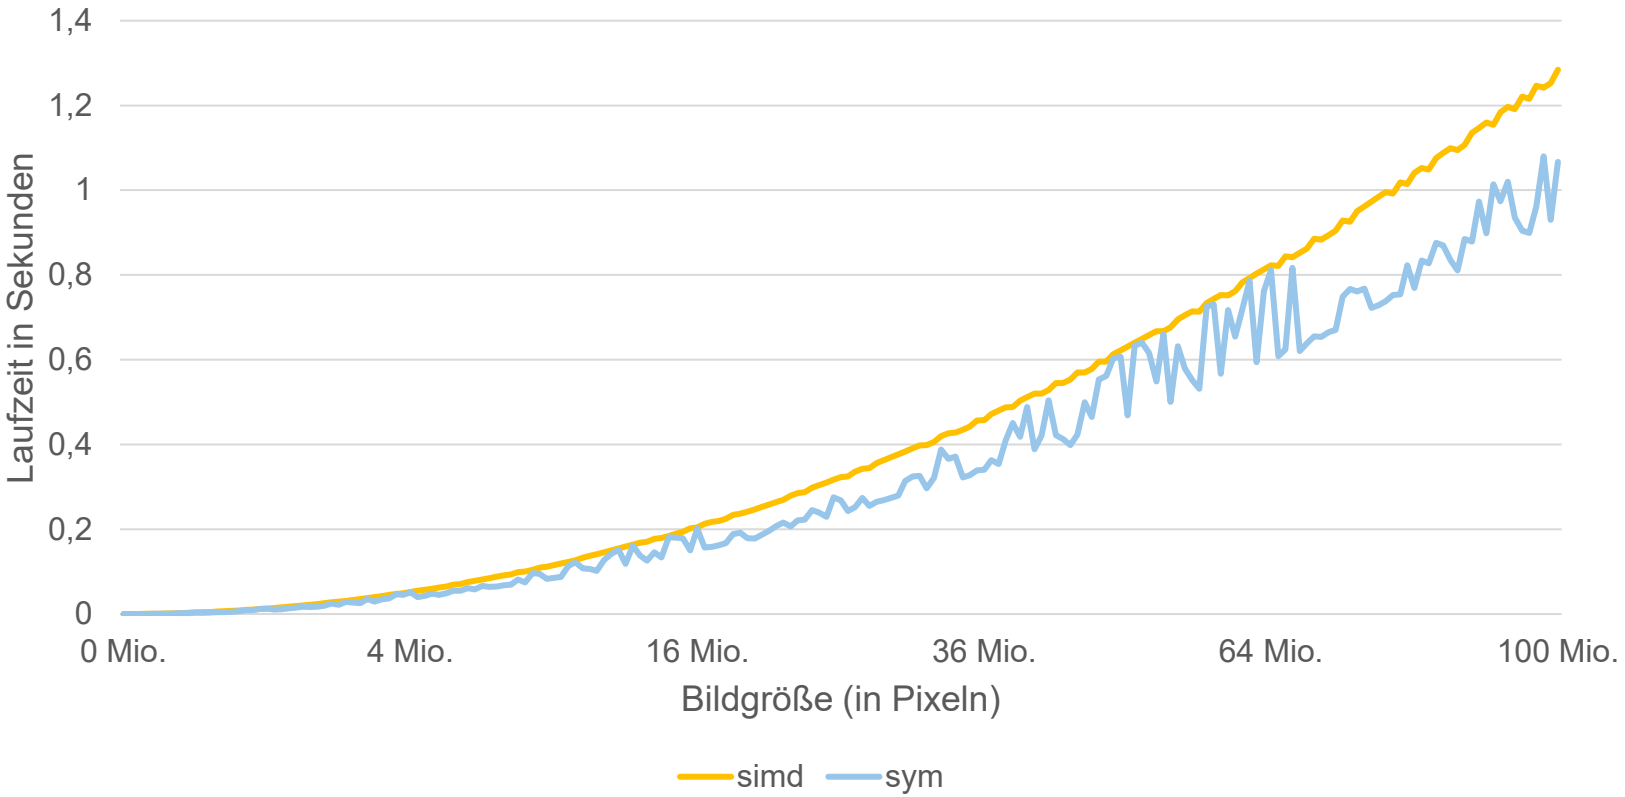

Laufzeit (pro Pixel): Naiv vs. SIMD

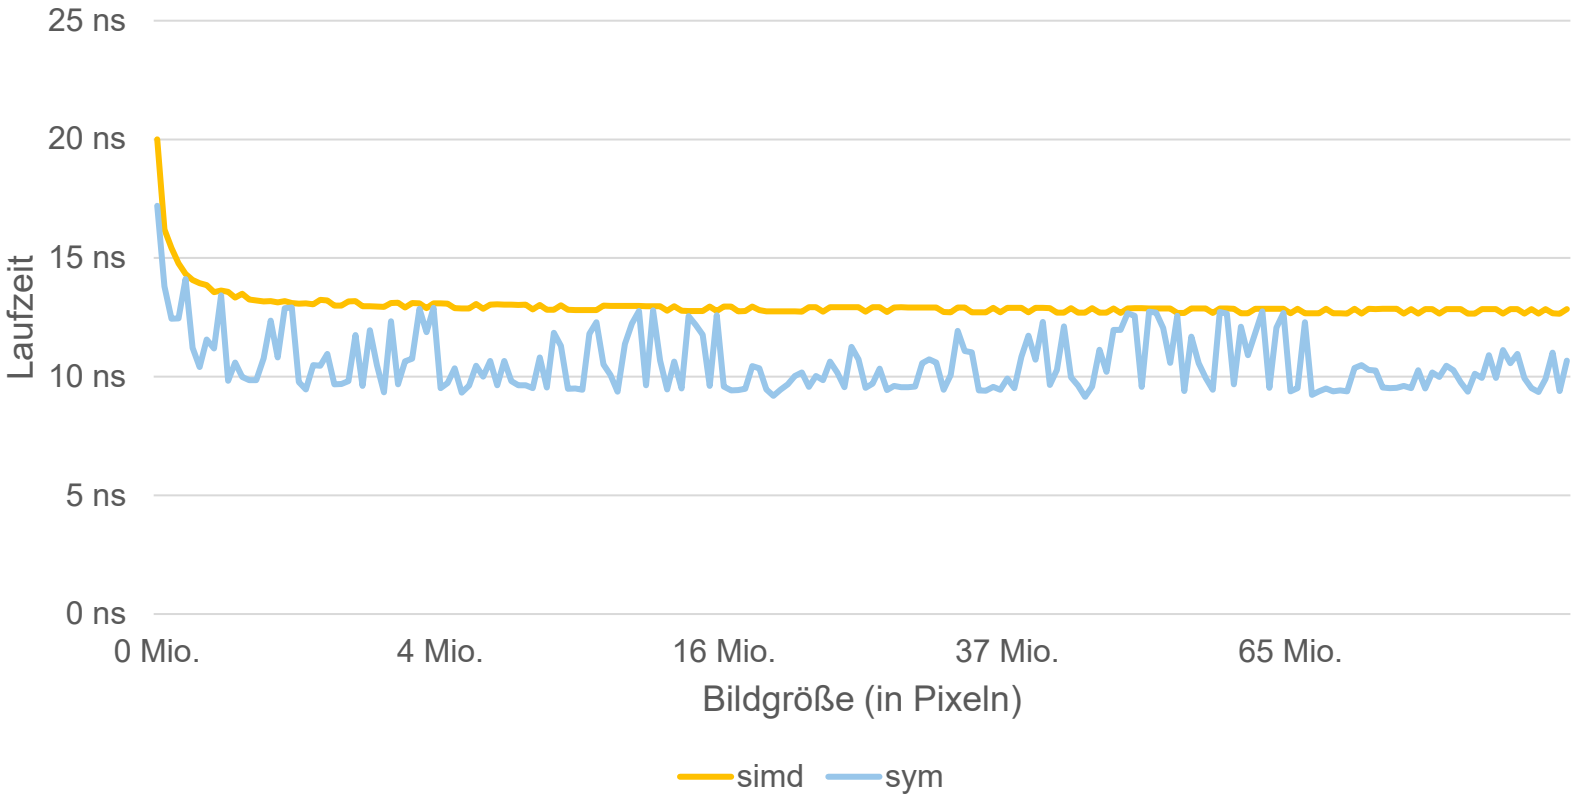

Symmetrie Optimierung

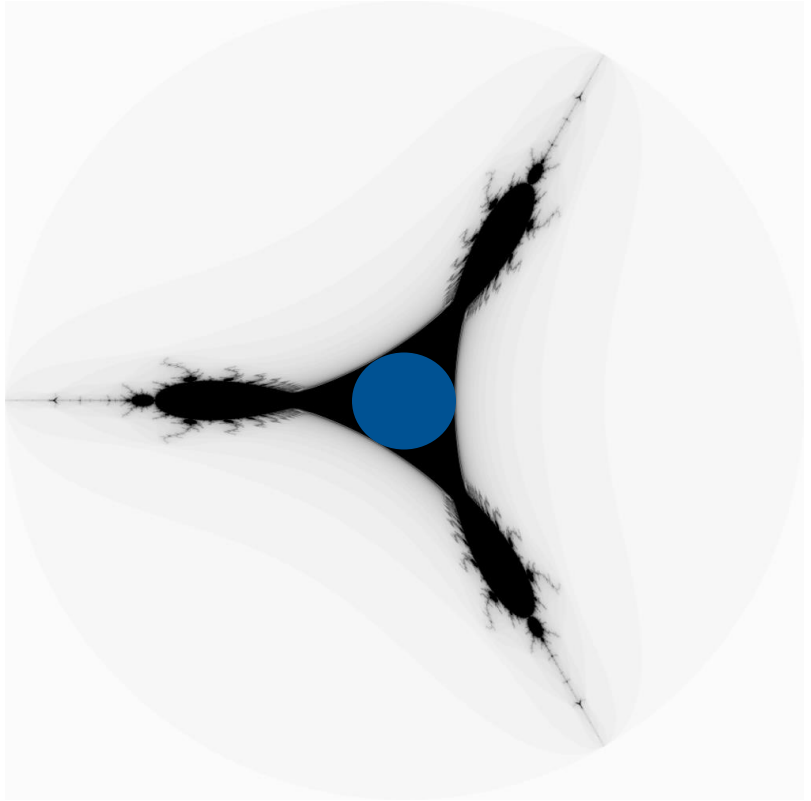

Laufzeit (Bildgröße): SIMD vs. Sym

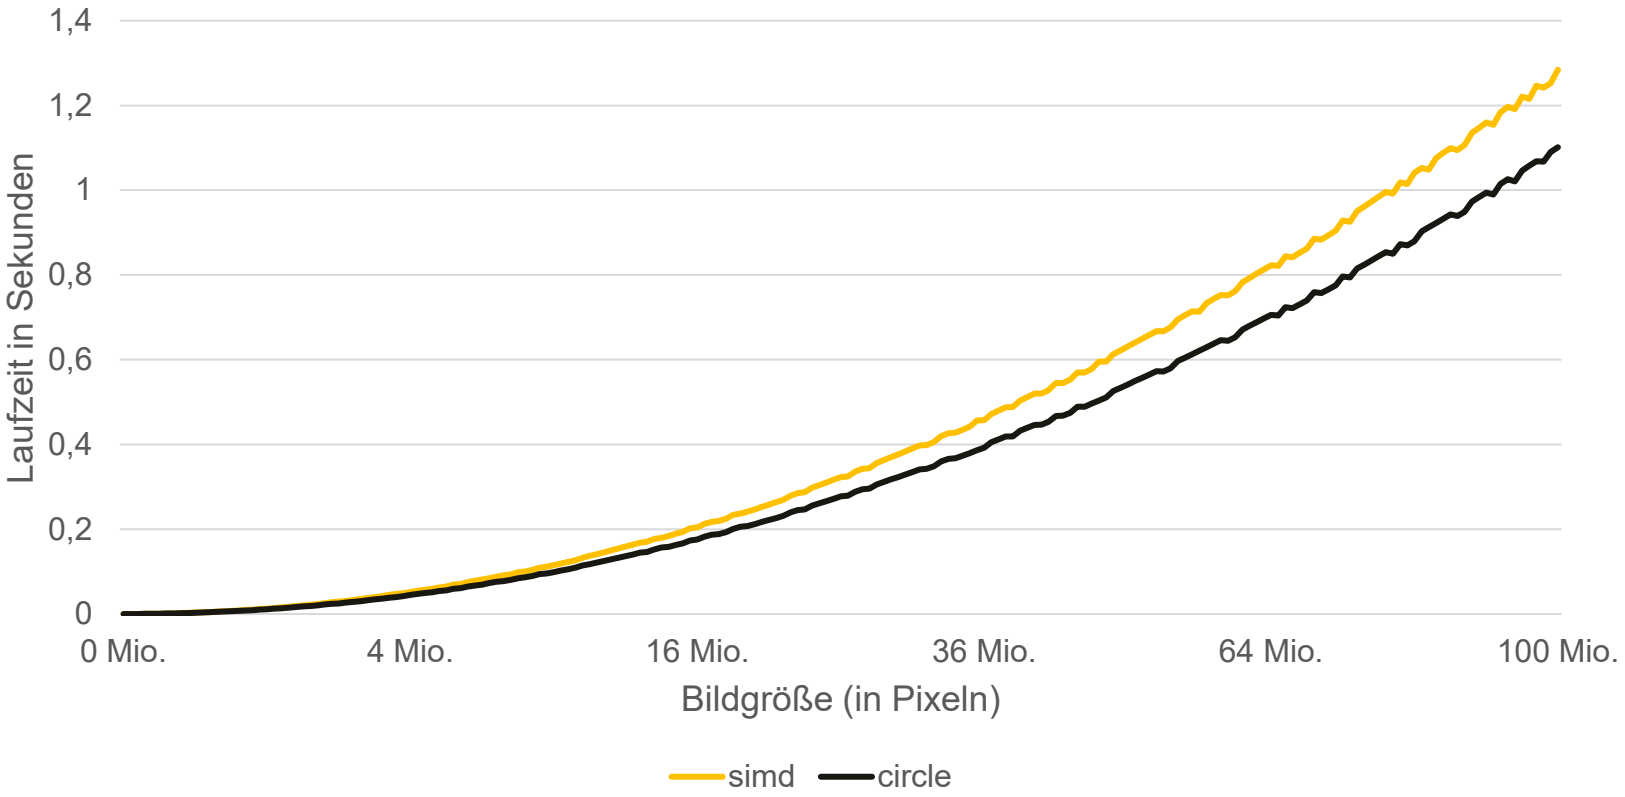

Laufzeit (pro Pixel): SIMD vs. Sym

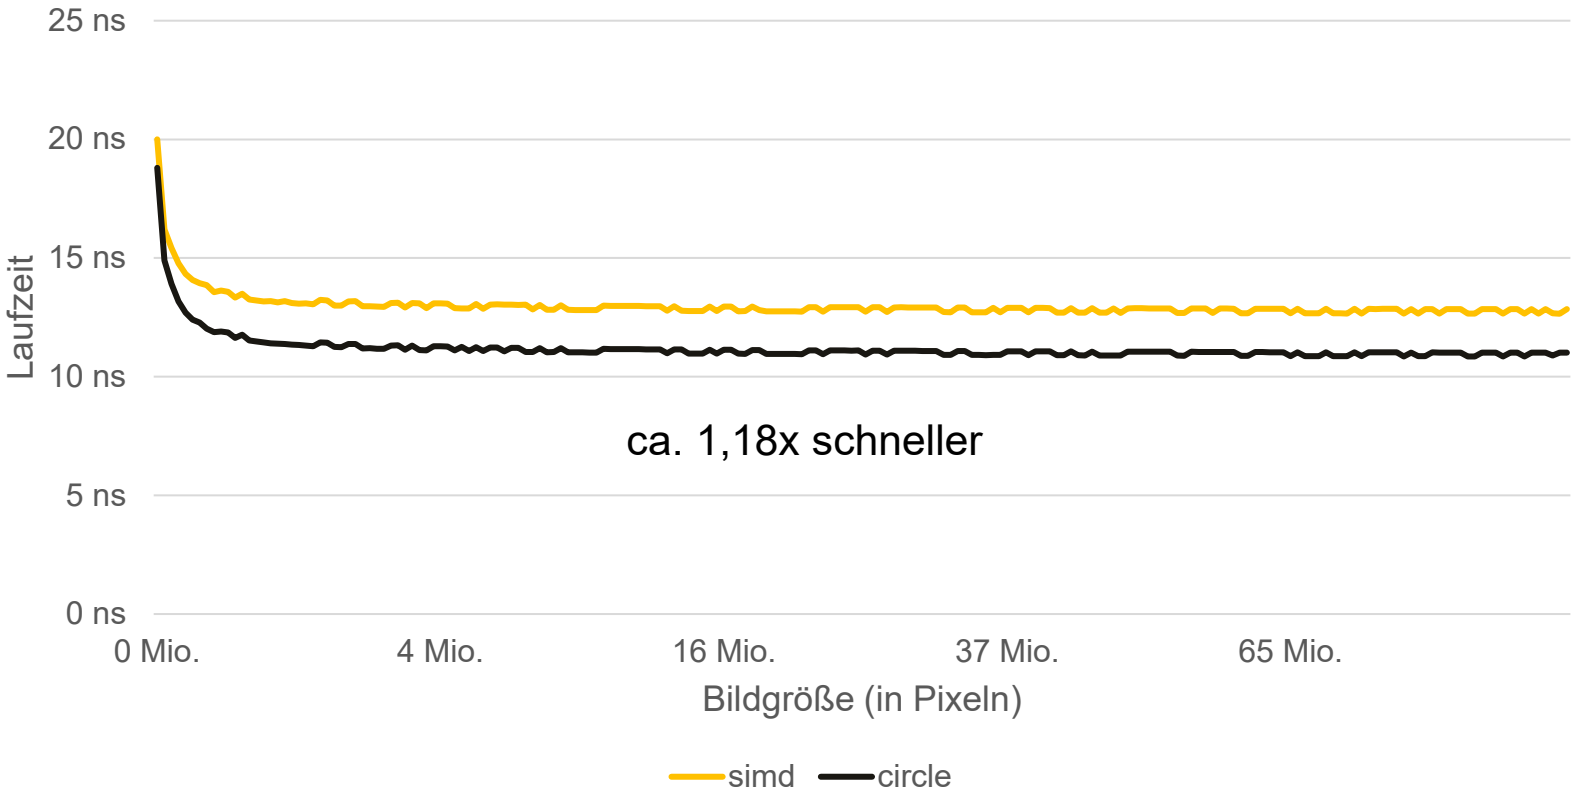

Circle Optimierung

Laufzeit (Bildgröße): SIMD vs. Circle

Laufzeit (pro Pixel): SIMD vs. Circle

Latency Throughput

_mm_add_ps (Intel Intrinsics)

Latency and Throughput

Architecture	Latency	Throughput (CPI)
Alderlake	-	0.5
Icelake Xeon	4	0.5
Sapphire Rapids	-	0.5
Skylake	4	0.5

8x Unterschied

Latency Throughput

```
x = _mm_add_ps (a, b)

_ = _mm_add_ps (_, x)
```

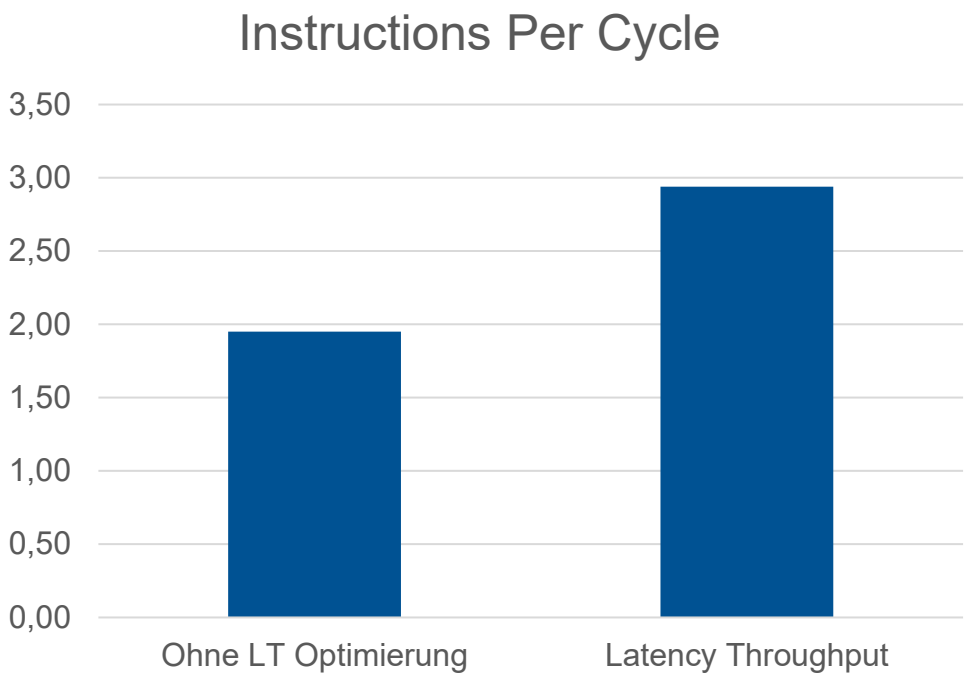

```
x = _mm_add_ps (a, b)
y = _mm_add_ps (c, d)

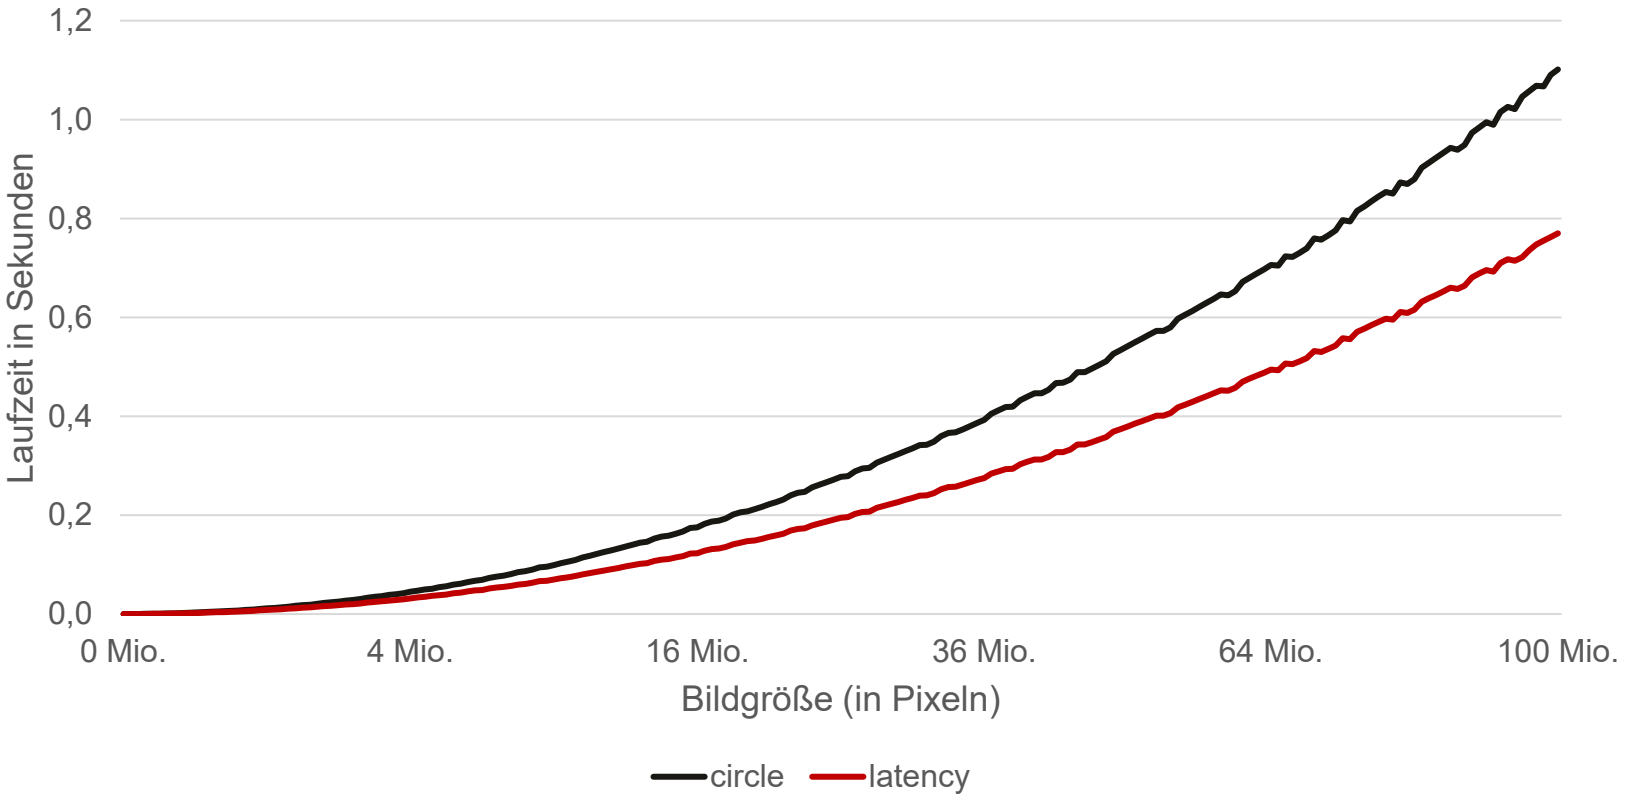

_ = _mm_add_ps (_, x)
_ = _mm_add_ps (_, y)
```

Latency Throughput

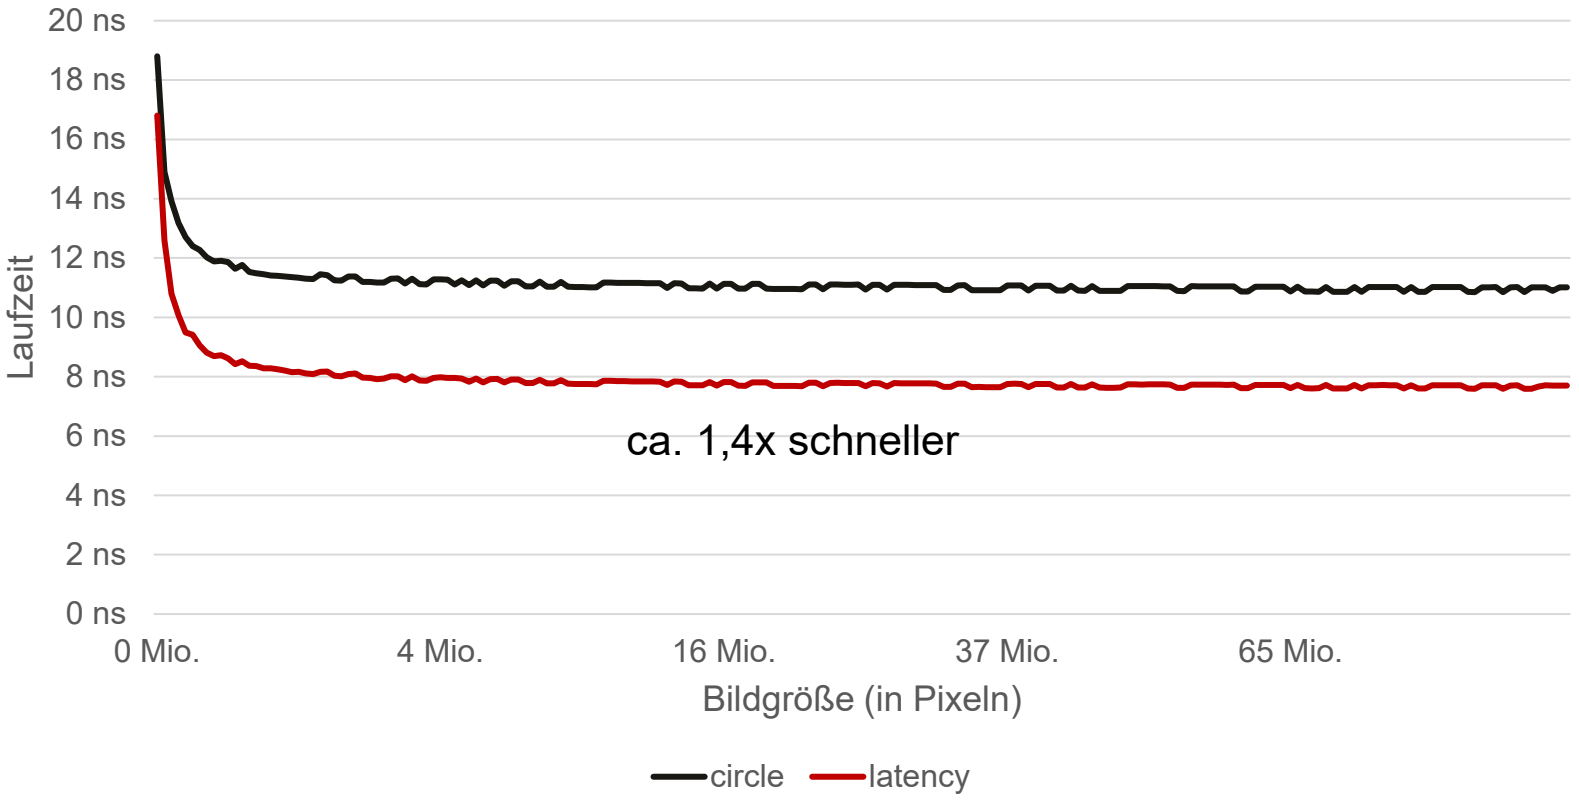

Perf Analyse

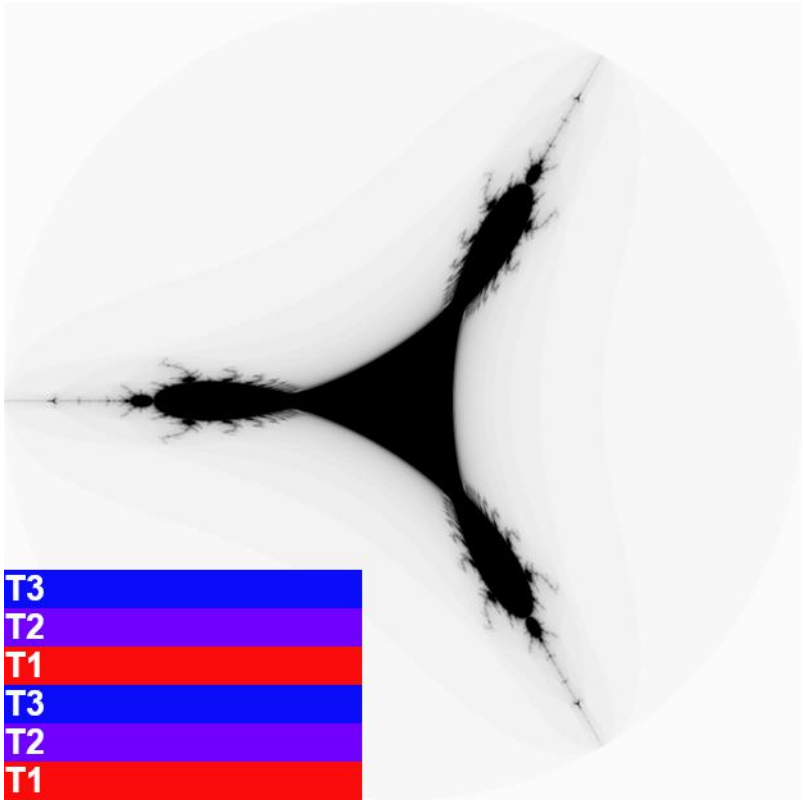

Laufzeit (Bildgröße): Circle vs. Latency

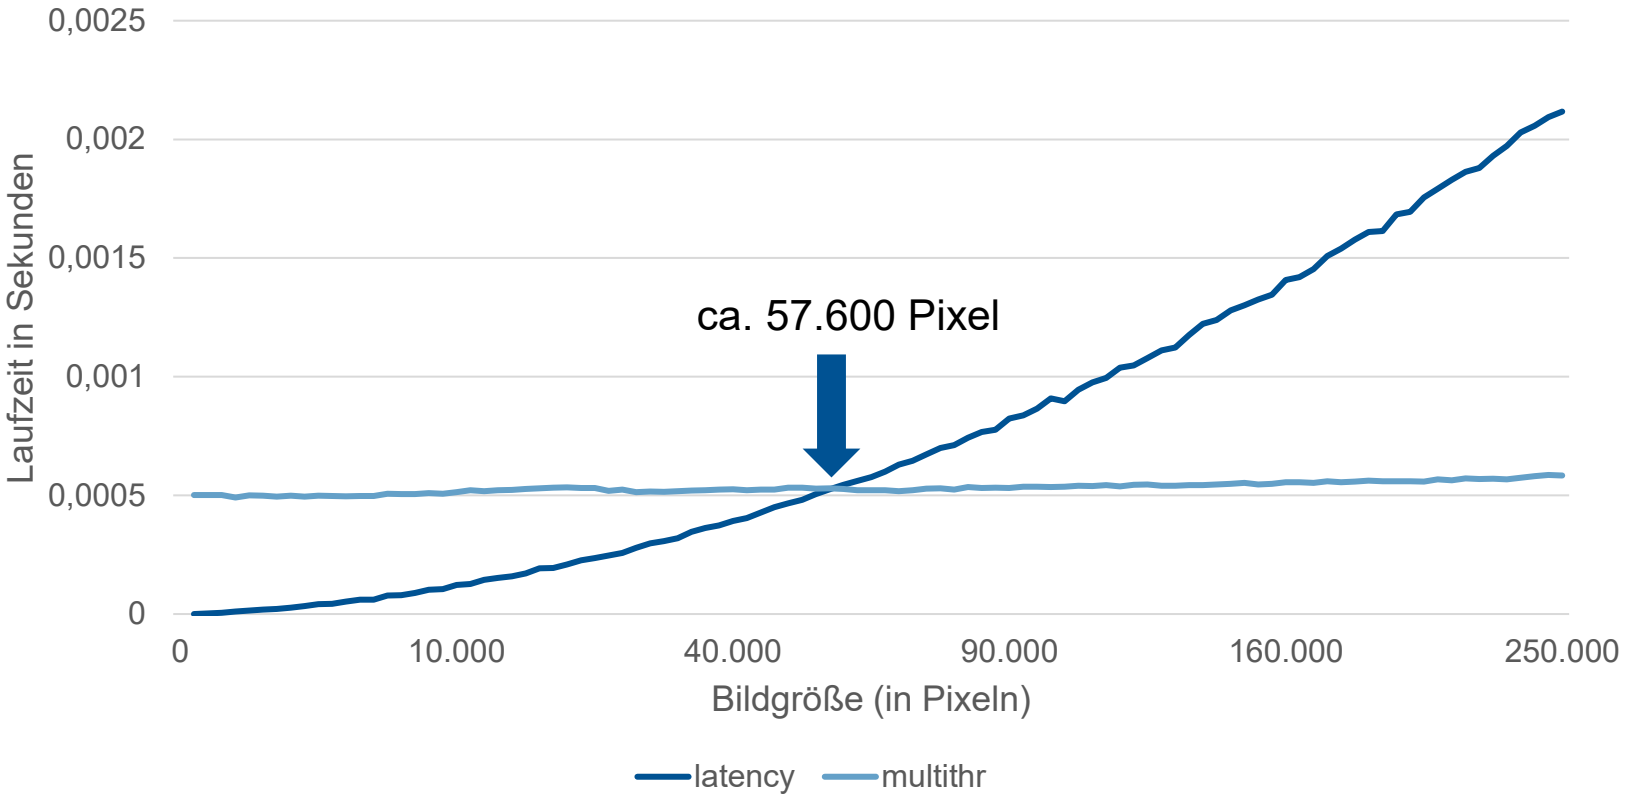

Laufzeit (pro Pixel): Circle vs. Latency

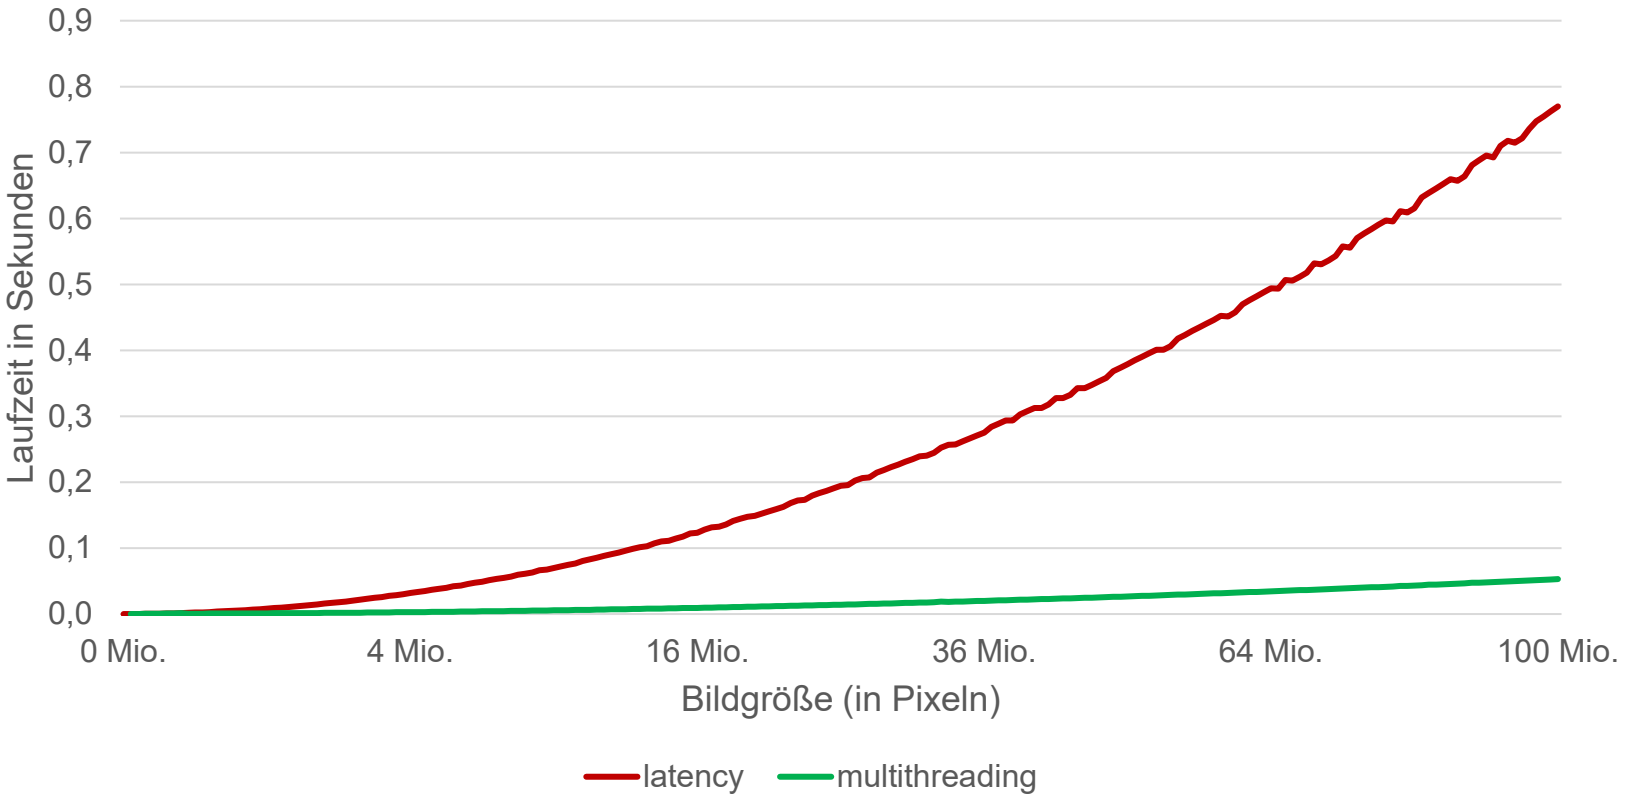

Multithreading

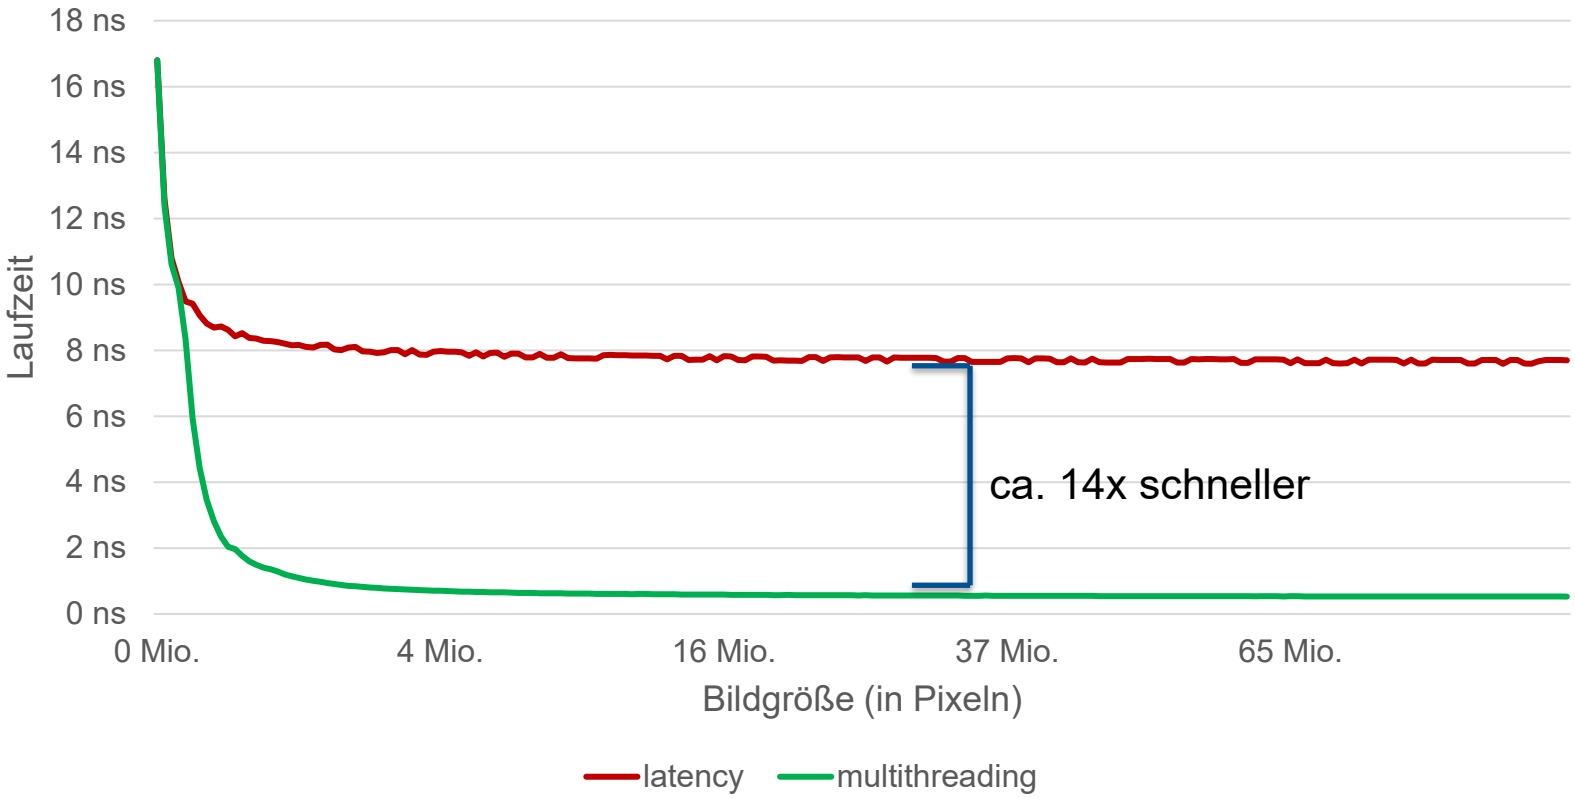

Thread-Overhead

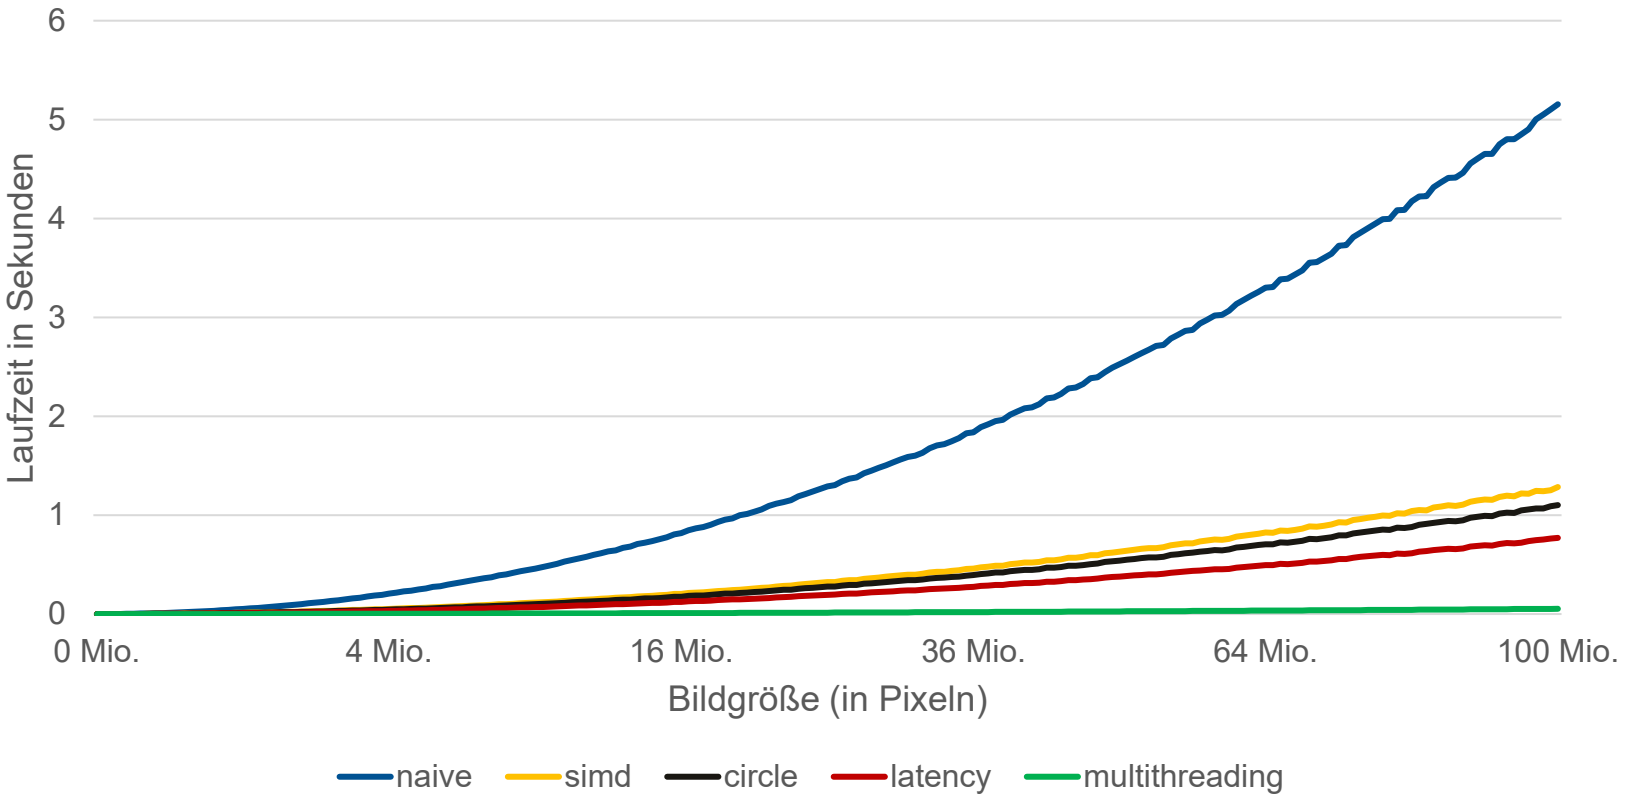

Laufzeit (Bildgröße): Latency vs. Threading

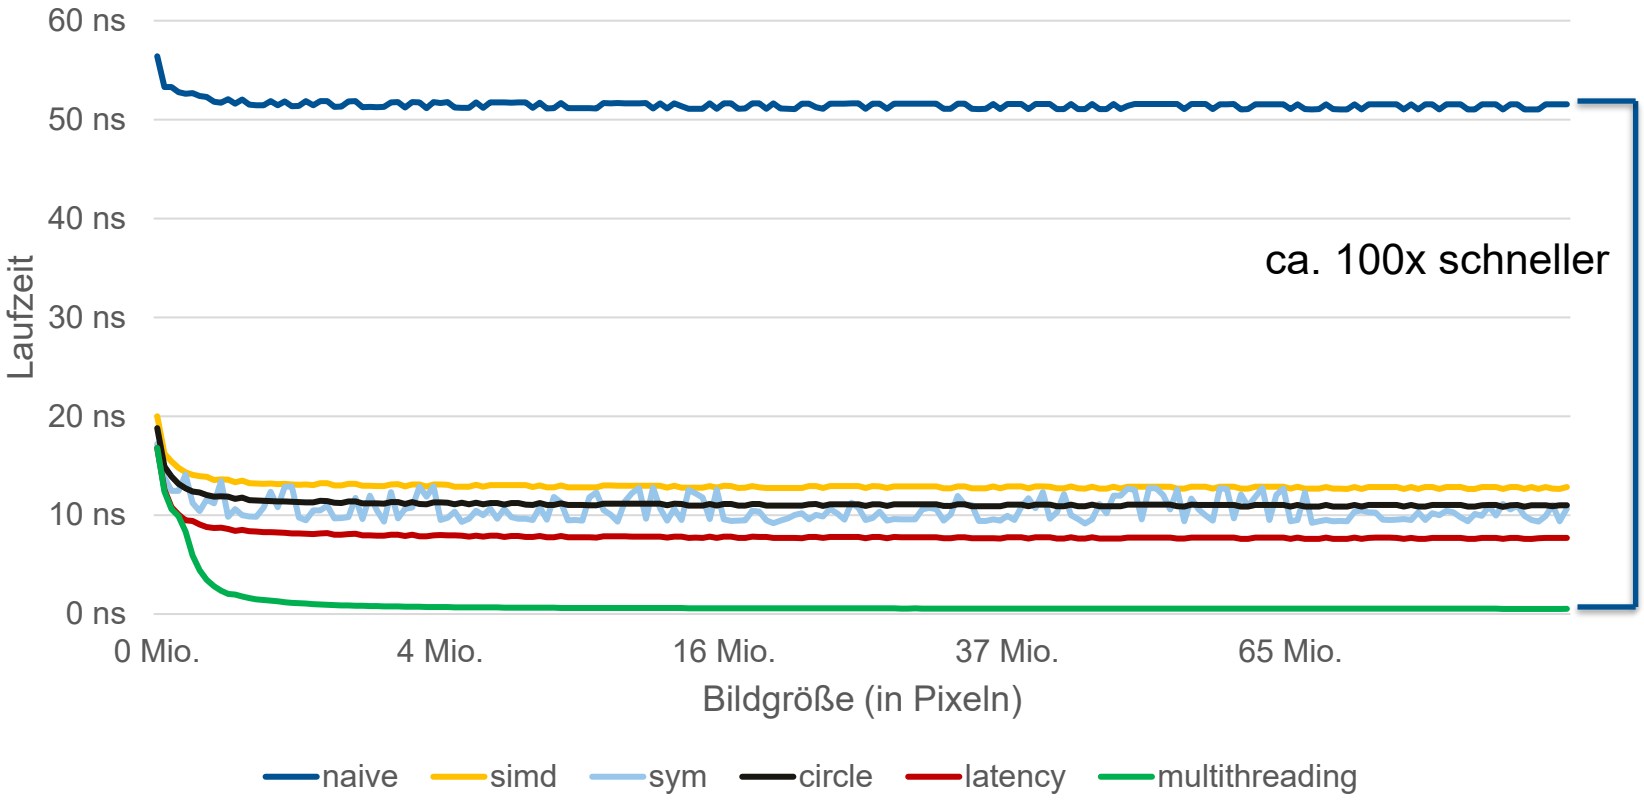

Laufzeit (pro Pixel): Latency vs. Threading

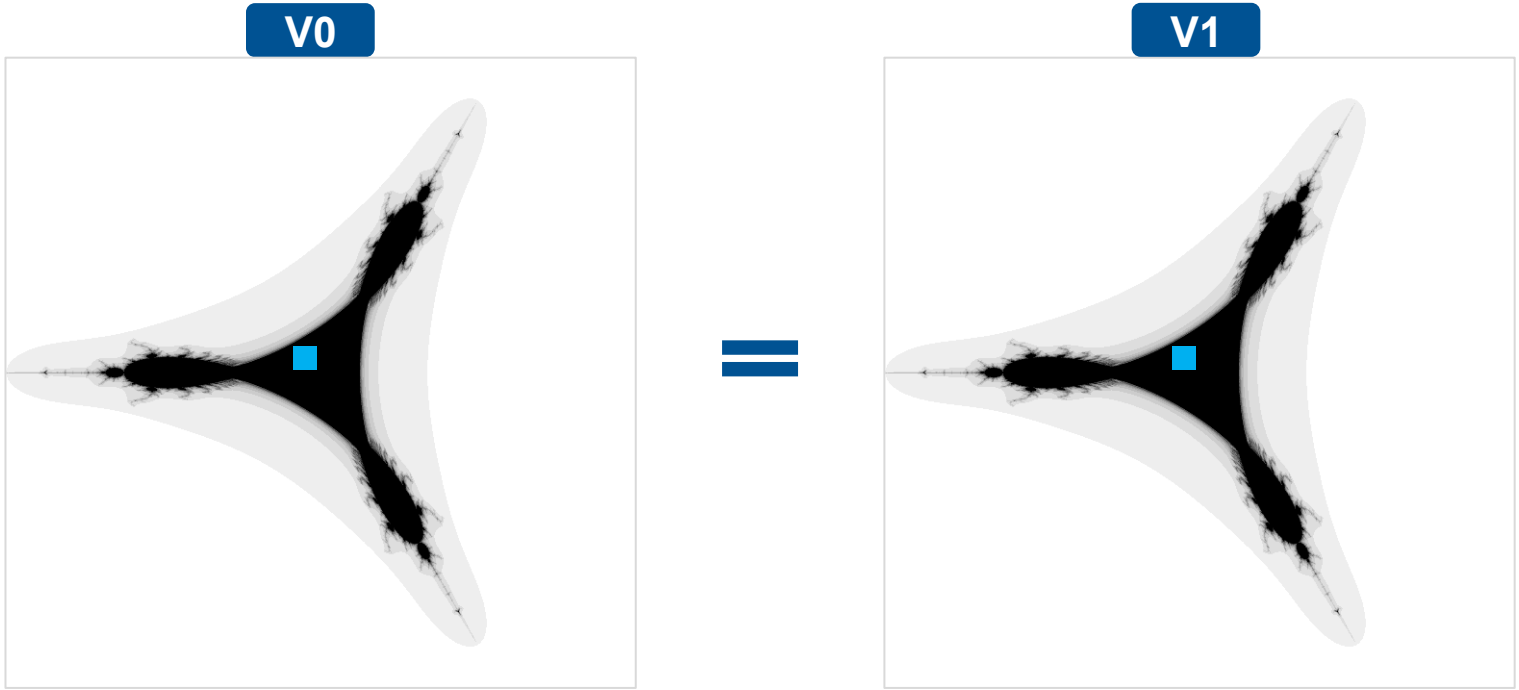

Laufzeit (Bildgröße)

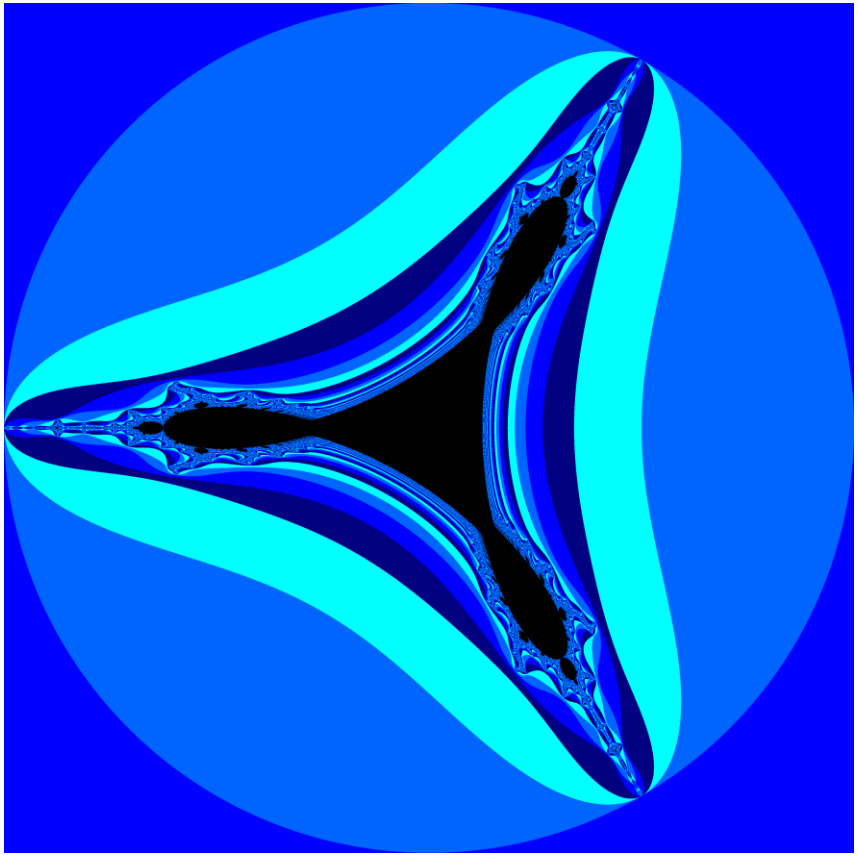

Laufzeit (pro Pixel)

Korrektheitsanalyse

Testumgebung

- AMD Ryzen 9 5900X (12-Core, 3.7GHz) 32 GB Arbeitsspeicher
- Ubuntu 26.04 (64 Bit), Linux-Kernel 7.0.0-14-generic, kompiliert mit GCC 15.2 mit Flag: -O2
- quadratisches Bild mit Seitenlänge 50 bis 10.000 Pixeln (Schrittweite: 50)
- Resolution = $\frac{4}{Bildbreite}$ Iterationen = 256 Start = -2,-2
- beste Laufzeit aus drei Testdurchgängen
